

## **Evolution Shows Common Ancestors Between Organisms**

1. Comparing skeletal structures-  
cats, bats dolphins and humans all have a similar bone structure. They probably evolved from a common ancestor millions of years ago. (pictures on 114)
2. DNA – the genetic makeup (the directions for an organisms characteristics) can show a link between organisms.  
Cats and tigers have similar DNA  
Which means they probably evolved from a common ancestor a long time ago
